E-Commerce funnel diagnosis: where do shoppers drop off?

45,35,941	156K	3.43%
Sessions	Purchase sessions	Session conversion

Session conversion by month

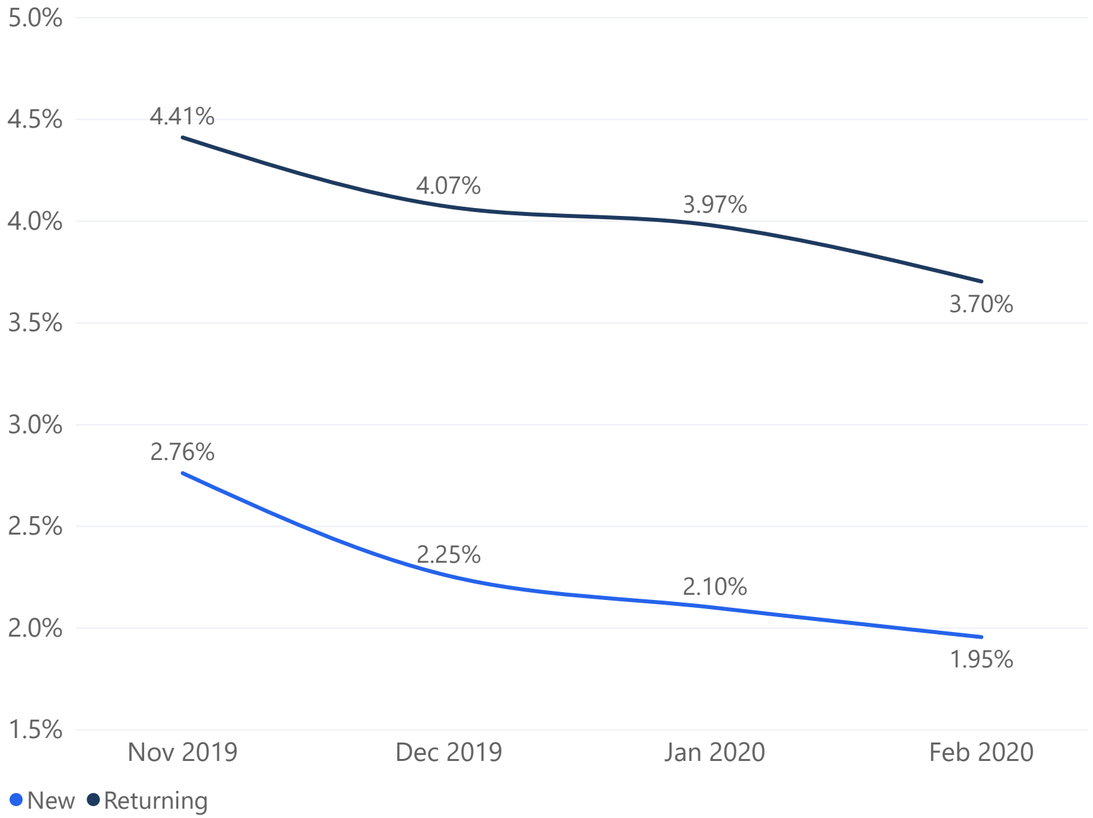

Where sessions drop off

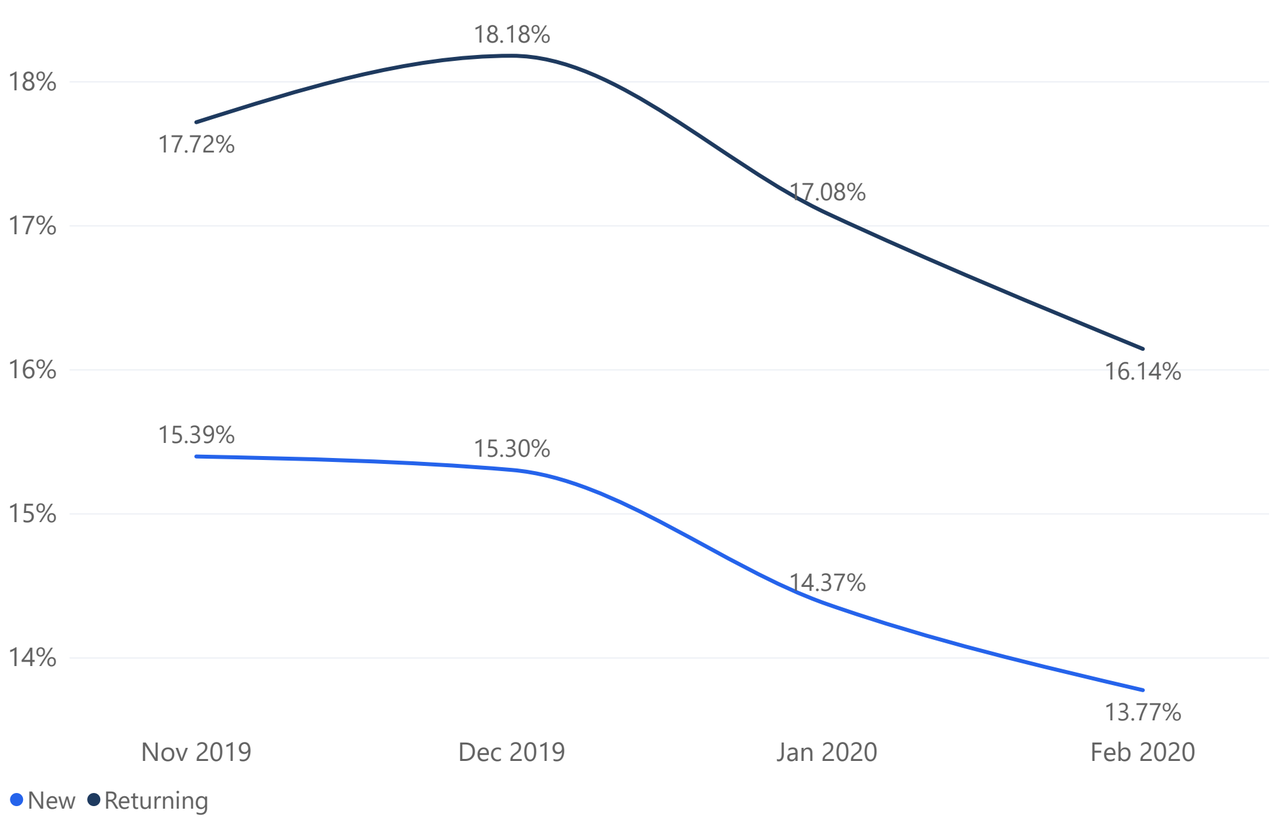

Only 3.43% of sessions end in a purchase. About 82% of sessions that view never add to cart, and conversion peaked in November (3.86%) before sliding to 3.13% in February.

Do new and returning shoppers behave differently?

Session conversion: new vs returning

Cart-to-purchase: new vs returning

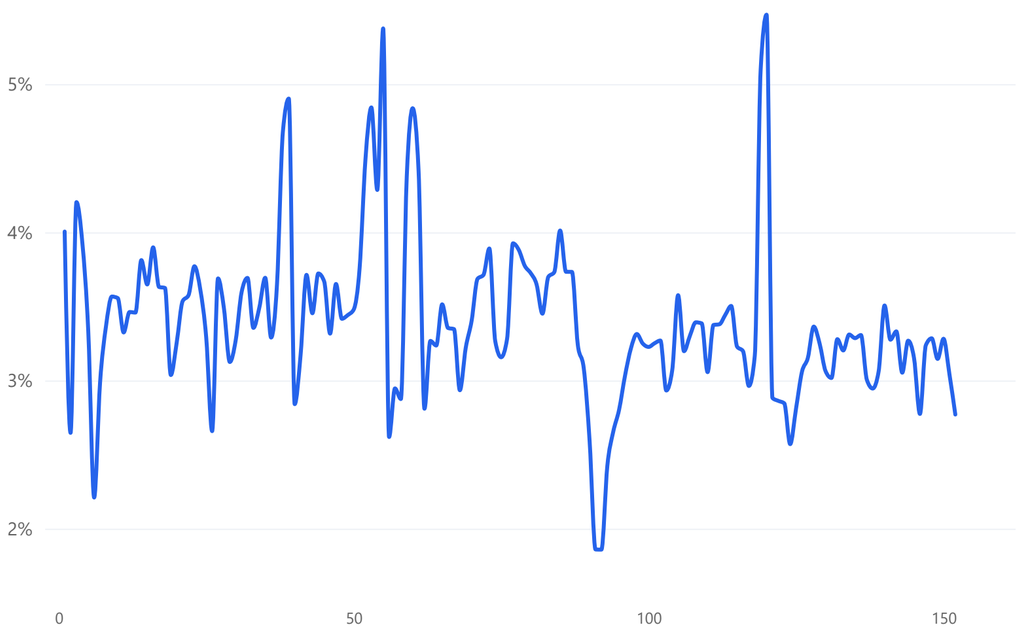

Returning shoppers convert 1.6x (Nov) to 1.9x (Feb) better than new shoppers. Both groups declined after November, mainly at cart-to-purchase. The share of new shoppers fell from 35.8% to 32.4% between Dec and Feb, which would have raised conversion, so shopper mix does not explain the decline.

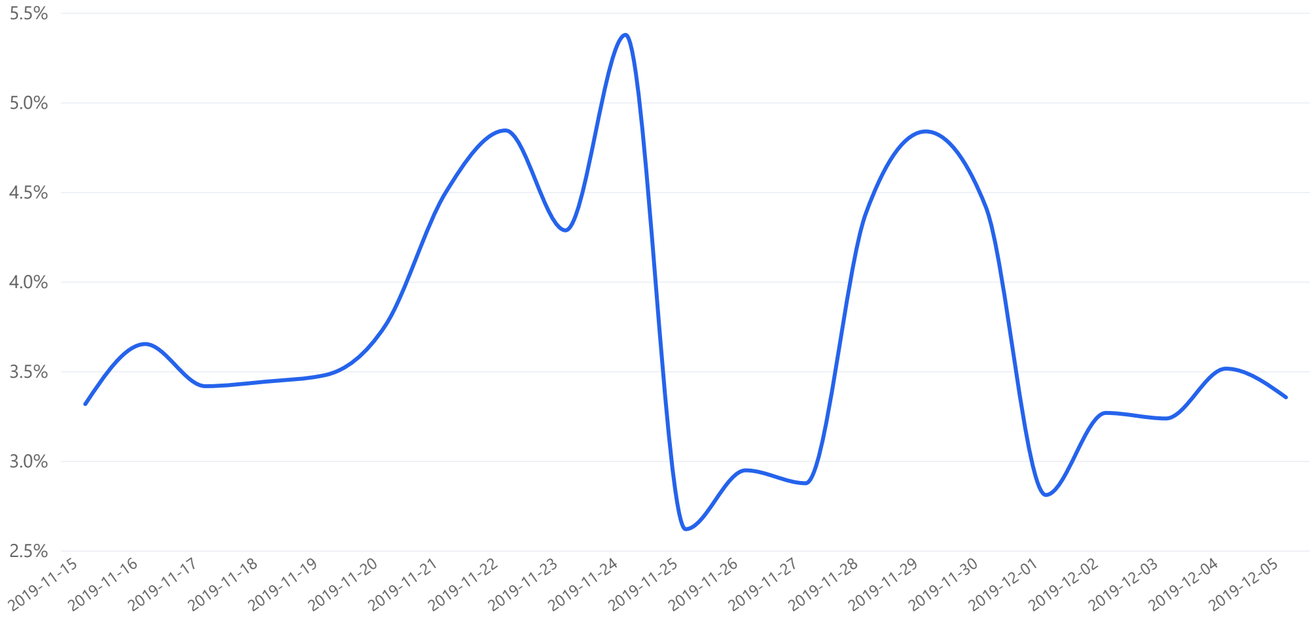

October is excluded because early "new" shoppers include people who shopped before 1 Oct.

What changed around Black Friday, and was February a data problem?

Daily session conversion

Zoom: 15 Nov to 5 Dec 2019

Excluding zero-price cart sessions

month	conv_all	conv_excl_zero_cart
2019-10	3.40	3.39
2019-11	3.86	3.84
2019-12	3.42	3.41
2020-01	3.33	3.32
2020-02	3.13	3.13

Conversion peaked on 21 to 24 Nov (up to 5.4%), dipped on 25 to 27 Nov (about 2.8%), then rose again on 28 to 30 Nov, including Black Friday (4.8%). There is no promotion data, so the cause is unknown. Removing the 4,415 sessions with zero-price carts changes monthly conversion by at most 0.02 points (February is 3.13% either way), so they do not explain February's decline.
